

Team 30: Smart Grid

...

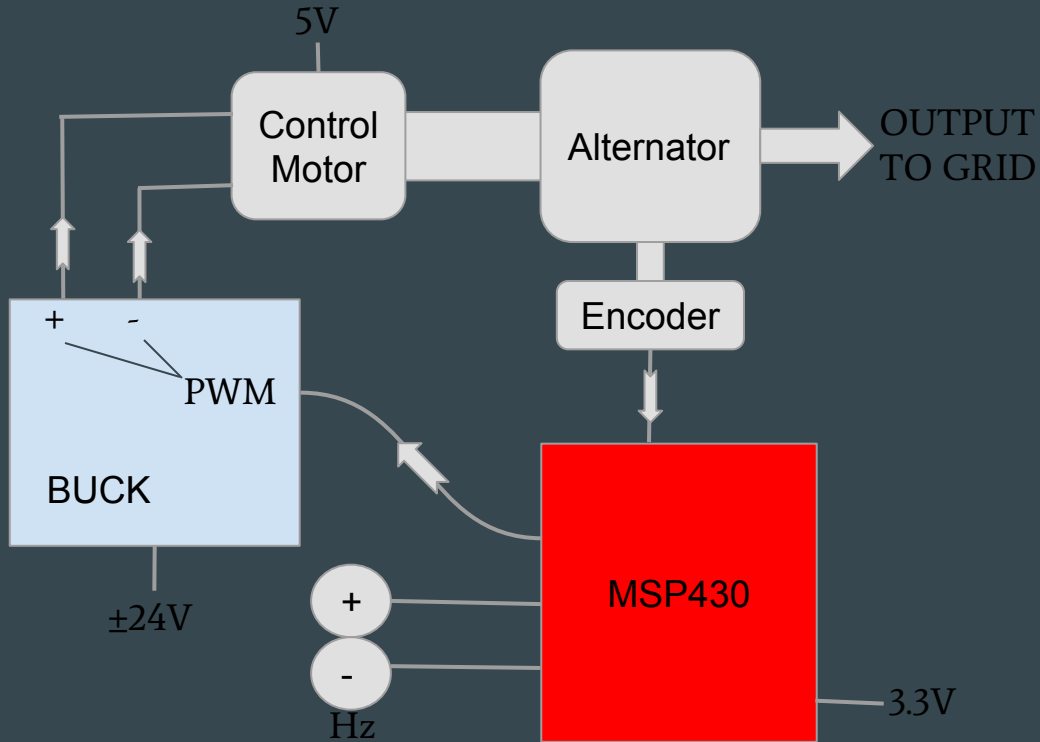

By: Aidan McCall and Jonas Escobar

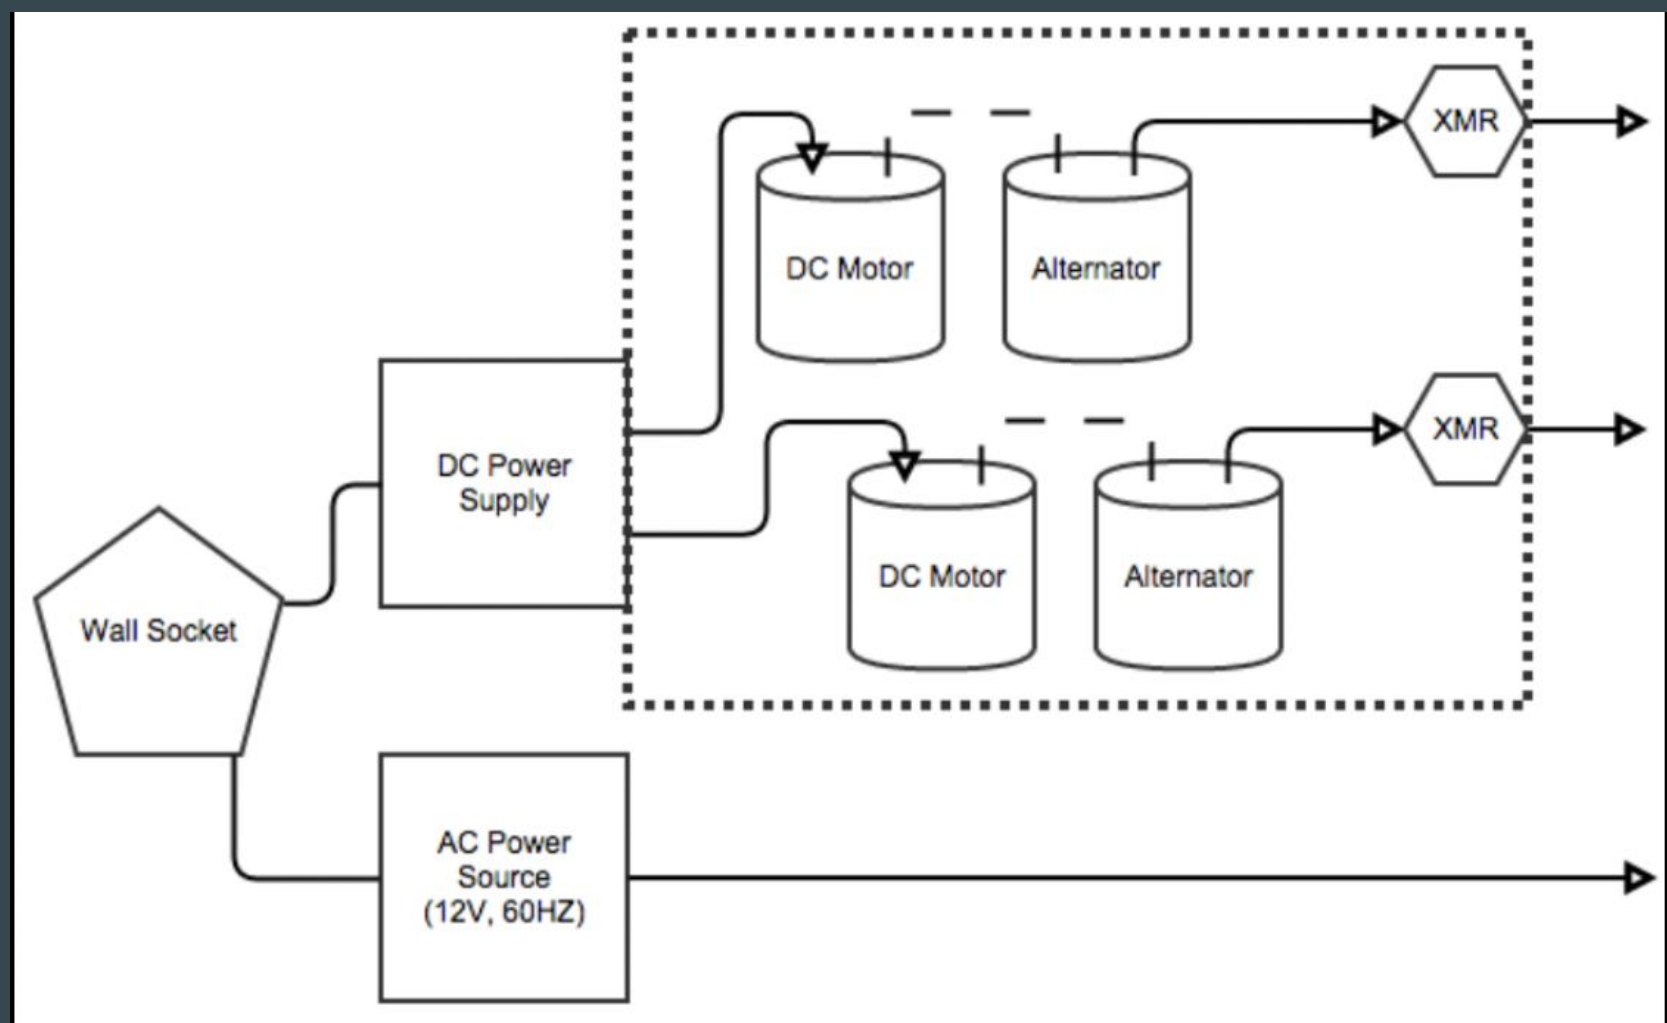

Problem Statement

We have a fully functional Electric Grid model from a previous Senior Design team that has no working method for data collection, so it cannot be properly utilized by professors for classes like EC 417.

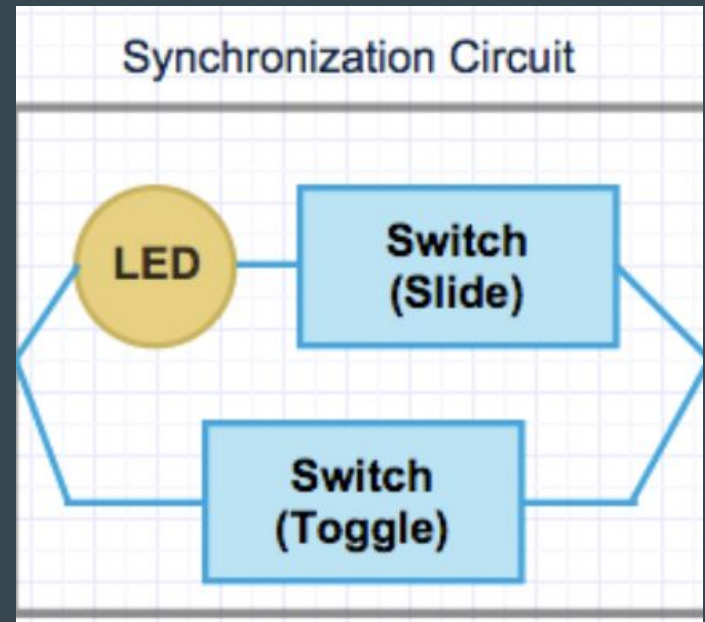

The Smart Grid Model

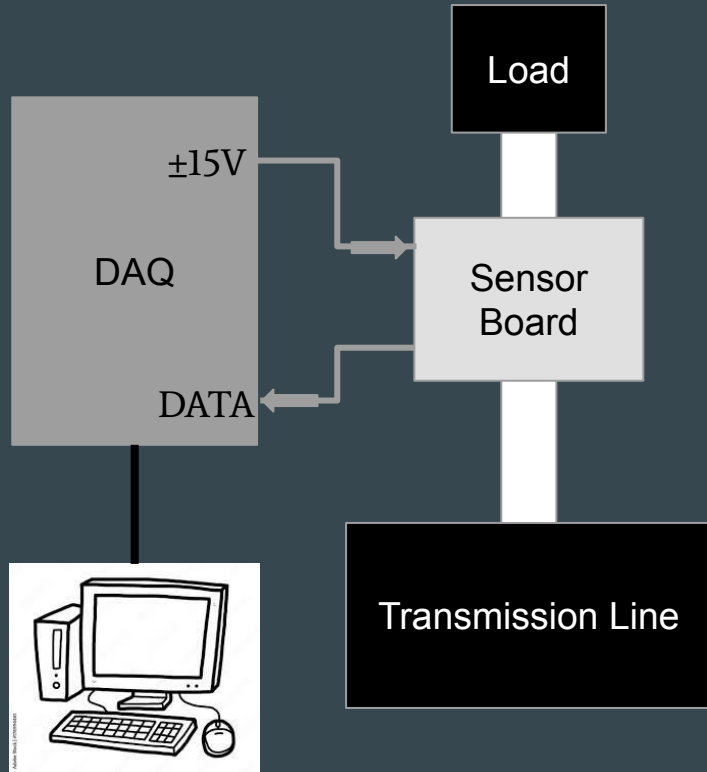

Synchronization

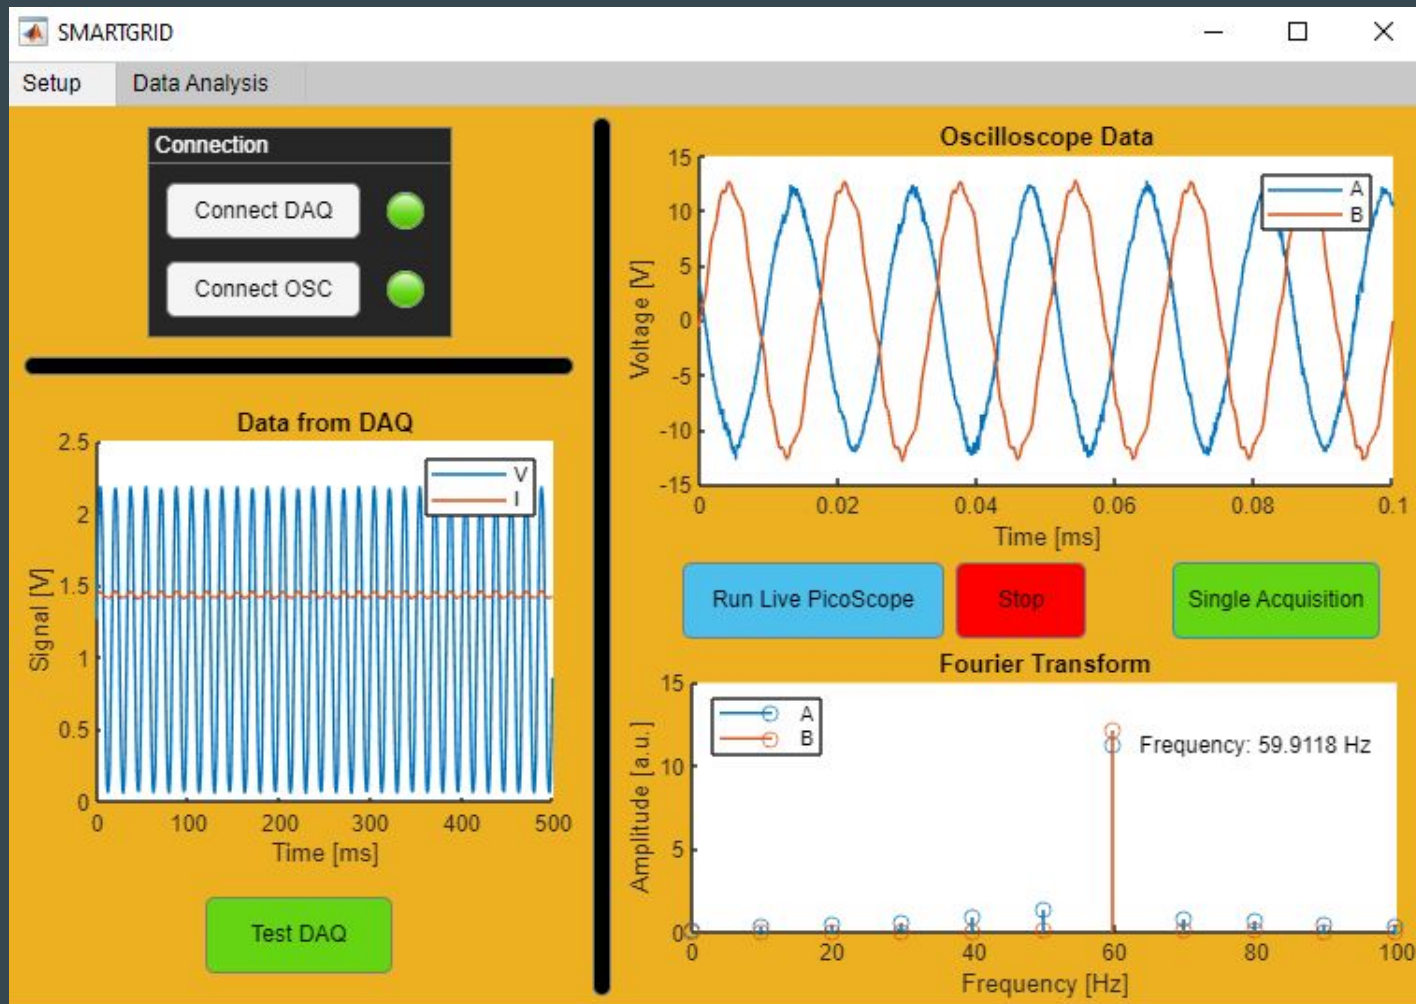

- Synchronization
 - "Sync Bulb" method
- Problem: LED can be hard to time and a big oscilloscope can practically be transported
- Solution: Picoscope

Data Collection

GUI

Next Steps

- Consolidate everything into one movable cart
 - Use the DAQ
- Update our GUI and DAQ code to be able to calculate phasors (and therefore power factor)
